

Below are **10 advanced-level Webflow assignments**, each designed to challenge learners with high-complexity features such as APIs, e-commerce, advanced CMS structures, multi-language sites, advanced interactions, conditional logic, and custom integrations.

These tasks simulate **real-world client projects** and push students toward expert-level mastery of Webflow.

10 Advanced Webflow Assignments (Expert Level)

1. Build a Fully Dynamic Multi-Language Website (No Plugins)

Requirements:

- Create **two CMS Collections**:
 - **Languages** (English, Arabic, French, etc.)
 - **Translated Content** (fields: page reference, language reference, title, body, images)
- Build dynamic pages that switch content based on:
 - A **language selector** in the navbar
 - **Conditional visibility** for multi-language content blocks
- Use **Symbols (Components)** for recurring multilingual UI blocks.
- Ensure RTL (Right-to-Left) support for Arabic / Urdu layouts using custom CSS.

2. Develop an E-Commerce Store With Custom Filters & Dynamic Search

Requirements:

- Build a Webflow **E-commerce** store with:
 - Product categories (CMS reference fields)
 - Price ranges
 - Tag-based filtering
- Create an advanced filtering system using:
 - Conditional visibility
 - Webflow's native filter
 - Optionally, **Finsweet CMS Filter**
- Implement a **live search bar** using custom code.

- Add an animated cart interaction that opens on click.

3. Create a Fully Custom Webflow Membership Portal

Requirements:

- Use **Webflow Memberships** to create:
 - Free user role
 - Premium user role
- Design:
 - Sign-up & login pages
 - Locked premium content pages
- Dynamic dashboards showing:
 - User details
 - Saved articles (CMS)
 - Custom "Welcome Back" messages
- Add logout interactions and UI animations.

4. Build a Webflow App That Uses a Third-Party API (e.g., Weather, News, Currency Rates)

Requirements:

- Use **Custom Code + Webflow Embed** to call an external API.
- Display:
 - Fetched API data inside HTML embeds
 - Dynamic UI elements styled in Webflow
- Create a CMS collection to store "Favorite API Results."
- Add user interaction (button to refresh or load data).

5. Create a Webflow-Powered SaaS Marketing Site With a Feature Calculator

Requirements:

- Build a SaaS homepage with sections:
 - Hero, Features, Pricing, Testimonials
- Create a **pricing calculator** using:

- Custom JavaScript
 - Webflow form elements
- Results should update dynamically (e.g., monthly cost).
- Use **Lottie animations** for UI feedback.

6. Build a Mega CMS Blog Infrastructure With Authors, Categories & Tags

Requirements:

- Create **three CMS collections**:
 - Blog Posts
 - Authors
 - Tags
- Use two reference fields in Blog Posts:
 - Author reference
 - Multi-reference Tags
- Create:
 - Blog category pages (dynamic)
 - Author profile pages
 - Tag index pages
- Add a **related posts** system using conditional logic + category match.

7. Animate a 3D Landing Page With Scroll-Triggered Interactions

Requirements:

- Add a **Lottie JSON** 3D animation into the hero.
- Create scroll-based animations:
 - Parallax images
 - Rotating 3D elements
 - Sequential section reveals
- Use **Interaction Timelines** for smooth multi-step animations.
- Ensure performance optimization (lazy load, reduced motion version).

8. Create a Webflow Dashboard With Editable CMS Tables

Requirements:

- Build a dashboard-style page with:
 - CMS collection lists displayed as tables
 - Sortable columns (custom code or third-party libraries)
- Add CMS forms (Editor mode) for:
 - Adding new items
 - Editing records
- Highlight updates with animations (fade-in rows).

9. Build a Booking / Appointment System With Webhooks

Requirements:

- Create a **booking form** with:
 - Date picker
 - Time slot dropdown
 - Service selection
- Connect Webflow to **Make.com or Zapier** to:
 - Store bookings in Airtable
 - Send customer email confirmation
 - Send admin notification
- Add a CMS collection "Available Time Slots":
 - Hide fully booked slots using conditional visibility.

10. Create a Smooth One-Page Web App With Custom Router Navigation

Requirements:

- Build a one-page application with sections:
 - Dashboard
 - Analytics
 - Notifications
 - Settings

- Use interactions to create **smooth router-like transitions**:
 - Fade out → slide in animation
 - Persistent navbar (Symbol)
- Use custom code to update the URL hash (#dashboard, #settings).
- Add CMS-powered data cards that animate on load.
