

Five basic-level Bubble.io assignment questions, each with **clear implementation details**. These are suitable for beginners practicing core Bubble features such as pages, elements, workflows, data types, responsive design, and dynamic data display—based on the course topics established in the previous prompts.

Basic-Level Bubble.io Assignments

1 Assignment 1 — Build a Simple User Registration Form

Objective: Learn pages, elements, input handling, workflows, and saving data.

Features to Implement:

- Create a *Registration* page with the following input elements:
 - Name (text input)
 - Email (email input)
 - Password (password input)
- Add a **Sign Up** button and define a workflow:
 - *Create a new User* using Bubble's built-in User data type.
 - Save all inputs to the database.
- After registration, navigate the user to a *Welcome* page.
- Style the form using Bubble's **Styles tab** for consistent look and feel.

2 Assignment 2 — Create a Simple “Profile Page” Showing Dynamic Data

Objective: Practice dynamic pages, data types, and data display.

Features to Implement:

- Create a **Profile Page** set as a *type of content* = *User*.
- Display the logged-in user's:
 - Name
 - Email
 - Profile image (image uploader)
- Add an **Edit Profile** popup using:
 - Input fields to update user data
 - Workflows to “Make changes to current user”
- Use **Responsive Editor** to ensure layout adjusts on mobile.

3 Assignment 3 — Build a Simple To-Do List App

Objective: Practice data types, repeating groups, adding data, and filtering.

Features to Implement:

- Create a new data type: **Task**
 - Fields: `task_name` (text), `is_completed` (yes/no), `created_by` (User)
- Build a To-Do List page with:
 - Input box for new task
 - Button: "Add Task" → Workflow to create new Task
 - **Repeating group** displaying all tasks created by the current user
- Add a **checkbox** inside each repeating group row to mark tasks as complete.
- Add a filter to show:
 - "All tasks"
 - "Completed tasks"
 - "Pending tasks"

4 Assignment 4 — Create a Simple Searchable Product List

Objective: Use repeating groups, database relationships, and search/sorting features.

Features to Implement:

- Create a **Product** data type with fields:
 - `name` (text)
 - `description` (text)
 - `price` (number)
 - `image` (image)
- Add product entry form (admin-only or popup).
- Add a **search box** above a repeating group to filter products by name.
- Add a dropdown to *Sort By*:
 - Price: Low to High
 - Price: High to Low
 - Alphabetical
- Display product image, name, and price in each repeating group cell.

5 Assignment 5 — Implement Basic API-Based Email Notification (Using a Plugin)

Objective: Learn plugin usage, workflows, and integrating external services.

Features to Implement:

- Install an email plugin such as **Postmark** (or any email provider).
- Create a simple page with an input for:
 - "Recipient Email"
 - "Message"
- Add a button **Send Email** and configure workflow:
 - Use the plugin action to send an email with the entered message.
- Display an alert confirming "Email Sent Successfully."
- Add a log entry in the database (data type: *EmailLog*) storing:
 - Recipient
 - Message
 - Timestamp
