

10 intermediate-level Bubble.io assignment questions, each with **clear implementation details** that build on the basic skills learned earlier. These assignments introduce relational data, backend workflows, responsive logic, plugins, conditional formatting, API integrations, and app-level logic—perfect for students ready to create more complex functionality in their Bubble apps.

Intermediate-Level Bubble.io Assignments (10 Tasks)

1 Assignment 1 — Build a Multi-Step Form with Conditional Visibility

Objective: Learn conditionals, custom states, and multi-screen UI logic.

Features to Implement:

- Create a multi-step form with **3 steps** (e.g., Personal Info → Preferences → Summary).
- Use **custom states** to track active step.
- Each “Next” and “Back” button triggers workflows to switch sections.
- Display a final summary page pulling data dynamically from the inputs.
- Add responsive adjustments so steps stack vertically on mobile.

2 Assignment 2 — Build a Messaging System (Basic Chat)

Objective: Use relational data types, repeating groups, and auto-refresh.

Features to Implement:

- Create data types:
 - **Conversation** (participants: list of Users)
 - **Message** (text, sender, conversation, timestamp)
- Build a chat page showing:
 - Left side: list of user conversations
 - Right side: messages in the selected conversation
- Messages appear in a repeating group sorted by timestamp.
- Add auto-scroll to the latest message.
- Allow sending a new message and update in real-time using “Do Every 1 Second” workflow or RG auto binding.

3 Assignment 3 — Build a Simple Marketplace (List + Detail Pages)

Objective: Use relational data, dynamic pages, and search filters.

Features to Implement:

- Data types: **Listing** (name, price, image, seller, category).
- Create:
 - Marketplace home page with filters for category & price.
 - Dynamic listing page using **type of content = Listing**.
- Add sorting dropdown:
 - Newest
 - Lowest Price
 - Highest Price
- Add a "Contact Seller" popup linked to the Seller's user data.

4 Assignment 4 — Create a Favorites / Wishlist Feature

Objective: Practice list fields, database updates, and conditions.

Features to Implement:

- Add "Favorites" (list of Listings) to User datatype.
- On a product's dynamic page, add a **heart icon**:
 - If item is favorited → show filled heart
 - Else → outline heart
- Workflow toggles favorite/unfavorite.
- Create a "My Favorites" page showing the user's saved items.

5 Assignment 5 — Implement Role-Based Access (Admin vs User)

Objective: Use privacy rules, conditionals, and workflow restrictions.

Features to Implement:

- Add field `role` (User): "user" or "admin".
- Hide admin-only pages unless Current User's role = admin.
- Admin panel features:
 - Approve or disable listings
 - View all users

- Remove reported content
- Add redirects preventing unauthorized access.

6 Assignment 6 — Build a Notification System (In-App Alerts)

Objective: Use database triggers, backend workflows, and conditional UI.

Features to Implement:

- Create **Notification** data type (message, link, user, is_read).
- Show a bell icon with unread counter.
- When user clicks “Mark All Read,” update Notification list.
- Add workflow: When new message or event occurs → create notification.
- Notifications appear in a sliding group/popup.

7 Assignment 7 — Create a Booking System (Calendar + Slots)

Objective: Work with date/time pickers, availability logic, and constraints.

Features to Implement:

- Data types:
 - **Service**
 - **Booking** (user, service, start_time, end_time)
- Show available time slots (exclude already booked).
- User selects a service → selects date/time → makes booking.
- Prevent double bookings using Search constraints.
- Add booking cancellation workflow.

8 Assignment 8 — Implement API-Based Search (External API Integration)

Objective: Learn API Connector + displaying external data.

Features to Implement:

- Choose any open API (books, movies, weather, etc.).
- Create a search input that triggers API call.
- Display results in a repeating group (title, description, image).
- Add a “Save to My Library” button that:
 - Creates a new record in the local database for the user.

9 Assignment 9 — Build a Blog System with Comments

Objective: Use relational data, nested repeating groups, and slugs.

Features to Implement:

- Data types:
 - **Post** (title, body, author, main image, slug)
 - **Comment** (comment_text, commenter, post)
- Blog home page showing all posts.
- Dynamic blog page using slugs for SEO.
- Comment section under each post (nested repeating group).
- Admin-only option to edit/delete posts.

10 Assignment 10 — Create a Mini Analytics Dashboard

Objective: Use aggregations, charts, and dynamic filtering.

Features to Implement:

- Track actions such as:
 - New users
 - New posts
 - New bookings
- Use Bubble's built-in chart elements or plugin chart tools.
- Create filters:
 - Date range
 - User type
 - Activity type
- Dashboard shows:
 - Line chart (weekly signup trends)
 - Bar chart (top categories)
 - KPIs (total users, active users, recent actions)
